

[Alert message on the Psychology Press site](#)
[and text of the Errata sheet to be inserted in the books](#)

PLEASE NOTE

An algorithmic error has been detected in *EduG* version 5, which was used to produce the analysis results presented and discussed in this book. Components of variance for interactions involving both fixed and random facets are not correctly computed. This does not in any way detract from the value of the book as a tutorial on the principles and practice of generalizability theory.

The software problem has been resolved in version 6, which is available for download under the name *EduG 6.0 e*, from the following web address:

<http://www.irdp.ch/edumetrie/englishprogram.htm>

You should download and use version 6 for any future work that you do with G theory. But continue to use *EduG* version 5, which is now available as *PREVIOUS EduG* from the same web address, whenever you work through the practice examples in Chapter 5.
